

Part 2156

Open face conversion kit

Converts two headsets

The open face conversion kit **MUST** be fitted to the microphone when used in any open face style helmet or a helmet where the microphone is exposed to windblast. This kit acts as a wind guard to reduce windblast noise and also to prevent false activation of the VOX.

First: Ensure that the microphone fabric is clean and dry.

Second: Take one of the black velcro pads, remove the backing from the self adhesive velcro pad and apply it to the **BLACK** side of the microphone fabric.

Apply light pressure around the outside edges to ensure that it adheres to the black fabric. Avoid squeezing the middle of the front and back covers as this can cause the microphone to move which may cause damage to the fine microphone wires.

Third: Take one of the foam windsocks, carefully cut a small hole in the outer edge of the foam so it will be possible to slide the red connector and the boom through the small hole.

Forth: Slide the red connector and the boom through the small hole, then carefully position the foam windsock over the black fabric microphone cover so that the beige fabric part is exposed.

ONLY for use with Autocom domestic systems
